Received 15 September 1988

ABSTRACT. The paper presents the results of position photographing of comets carried out at the Skalnaté Pleso Observatory in the years 1977-1980. 57 observations of 7 comets are given together with the list of reference stars and dependences.

НАБЛЮДЕНИЯ КОМЕТ НА ОБСЕРВАТОРИИ СКАЛНАТЕ ПЛЕСО В 1977-1980 ГГ. Работа приводит результаты фотографических положений комет наблюдаемых на обсерватории Скалнате Плесо в 1977-1980 гг. Работа содержит 57 наблюдений 7 комет вместе со списком опорных звезд и зависимостей.

POZOROVANIA KOMÉT NA OBSERVATÓRIU NA SKALNATOM PLESE V ROKOCH 1977-1980. V práci sú uvedené výsledky pozičných fotografovaní komét na observatóriu na Skalnatom Plese za roky 1977-1980. Je uvedených 57 pozorovaní 7 komét spolu so zoznamom referenčných hviezd a dependencií.

## 1. INTRODUCTION

The presented paper is a continuation of previous papers which give the results of positional observations of comets made at the Skalnaté Pleso Observatory (the last paper of this series: Pittich, Svoreň; 1985) and contains positional comet observations made in the years 1977-1980. The observations were made with a 0.3-m f/5 Zeiss astrograph. The reduction constants of the Skalnaté Pleso astrograph are as follows:

$$\lambda = -1^{\text{h}} 20^{\text{m}} 58.70^{\text{s}},$$

$$\varphi = +49^{\circ} 11' 20.0'',$$

$$h = 1783 \text{ m.m.s.l.},$$

$$S = 0.99836 \text{ of the equatorial radius of the Earth.}$$

The comets were photographed on ORWO plates with ZU 2 emulsion, dimensions 24x24 and 9x12 cm, which roughly corresponds to fields of  $8.5^{\circ} \times 8.5^{\circ}$  and  $3^{\circ} \times 4^{\circ}$  respectively. The reference stars required to compute positions using Schlesinger's method of dependences, from two independent triangles were selected from the Star Catalog of the Smithsonian Astrophysical Observatory (1966). The differences between independent determinations of the equatorial coordinates, given for each position in Section 3, provide some information about the accuracy of the measuring. The rectangular coordinates of the reference stars and the comets were measured with the aid of instruments for measuring coordinates produced by Zeiss (Koordinatenmessgerät and Ascoremat E-60). The measurements were reduced by means of table calculators Hewlett-Packard 9830 A and EMG 666 and computer SM 4-20.

A total of 57 accurate positions of 7 comets, arranged according to the definitive designation of the objects, is given. A list of reference stars and dependences and a list of collaborators are also given, together with their share in photographing, measuring and reducing the positions.

## 2. POSITIONS OF COMETS

The data have been arranged according to individual comets in the order of their definitive designation. The individual columns of the tables containing the following:

N - ordinal number of observation,

Date U.T. - date and time of the middle of the exposure,

R.A.<sub>1950</sub> - right ascension for equinox 1950.0.

Decl.<sub>1950</sub> - declination for equinox 1950.0,

t - the exposure time in minutes,

O - observer,

M - measurer,

R - reduction.

3. REFERENCE STARS AND DEPENDENCES

The individual columns of the tables containing the following:

N - ordinal number of the observations in agreement with the Section 2,

Catalogue - the catalogue of reference stars,

Star numbers and dependences,

A - the difference between independent determination of the coordinates  
 $\Delta \alpha \cos \delta$  in arc seconds,

B - the difference between independent determination of the coordinates  
 $\Delta \delta$  in arc seconds,

C - notes.
