Received: February 28, 2012; Accepted: March 28, 2012

Abstract. The paper presents results of CCD astrometry of comets carried out at the Skalnaté Pleso Observatory in 2000. A total of 77 observations of 7 comets are given.

Key words: comets – astrometry

1. Introduction

The present paper is a continuation of the previous papers which gave the results of positional observations of comets made at the Skalnaté Pleso Observatory (the last paper of this series being Svoreň, 2002) and contains positional comet observations made in 2000.

The article contains the last cometary positions obtained by a 0,3-m f/5 astrograph of the Skalnaté Pleso Observatory and simultaneously the first positions obtained by a CCD camera. As it was already mentioned (Neslušan, 2002) the CCD detection technique was installed at the astrograph in early 2000. In December 2000, the astrograph was replaced, on the same mounting, by a 0.61-m f/4.4 mirror telescope (Svoreň et al., 2009) equipped with the same CCD camera SBIG ST-8. This telescope was designed and manufactured by Drbohlav & Son (Rtyně v Podkrkonoší) and it was installed on the original mounting of its predecessor. The CCD camera was placed at the Newton focus and the size of the observed sky area was 13×19 seconds of arc.

The reduction constants of the Skalnaté Pleso 0.61-m telescope are as follows:
$\lambda = -\ 1^h\ 20^m\ 58.70^s$,
$\varphi = +49^\circ\ 11'\ 20.0''$,
h = 1783 m a.s.l.,
$\rho = 0.99836$ of the equatorial radius of the Earth.

The reference stars were selected from the USNO-A V2.0 Star Catalogue (Monet et al., 1998). The method of plate constants and the computer programme Astrometrica (Raab, 1993) were used for reduction of obtained frames.

2. Positions of comets

The data have been arranged according to the new system designation. A list of collaborators is also given, together with their share in photographing, measuring and reducing the positions.

The individual columns of the table contain the following:
N – ordinal number of the observation
Date U.T. – date and time of the middle of the exposure
$R.A._{2000}$ – right ascension for equinox 2000.0 (in h, m, s)
$Decl._{2000}$ – declination for equinox 2000.0 (in °, ′, ″)
Magn. – R magnitude of the comet
Ref. st. – number of reference stars used to calculate the plate constants and photometric calibration of image
dα – the mean residual in R.A. (in s)
dδ – the mean residual in Decl. (in ″)
dmag – the mean residual in mag.
